

jBilling Product Data Sheet

jBilling delivers enterprise class billing

When it comes to features, scalability, robustness and flexibility, jBilling places itself first in its class. It is the only open source billing system listed in the catalog of the largest consulting companies.

- Mediation and Rating
- Full CDR support
- Invoice Presentation
- Payment Processing
- Flexible Service & Product Catalogue
- Business rules support
- Provisioning
- Administrative tools with multi-entity support
- Multi-currency & multi-tax processing

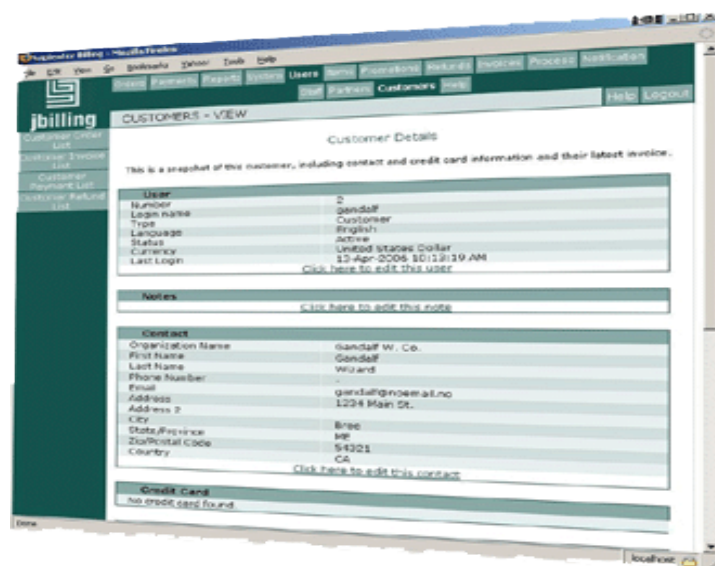

jBilling is Open Source

Open source is developed through a global community of contributors. Unlike proprietary software development, open source is not limited to the individuals hired by a specific company. Volunteers and individuals working for companies using jBilling contribute code, and through an extensive peer review, the best contributions are included in the final product. This collaborative process provides more innovation and bleeding-edge technology, faster and more securely than through closed source methods.

jBilling works on the web

jBilling has been designed from the start to be web-based, enabling universal, secure access to the billing system without any client installation.

jBilling provides both a full web GUI and a web services API. Use jBilling securely over the web with separate accounts for different users and different organisations. Integrate existing applications to jBilling using the web services API.

Technical Data

jBilling features:

- Web-based automated invoice generation and payment processing
 - Easily processes both one-time and recurring billing
 - Accepts many payment methods and processors
- Built on standard technologies such as Java, Tomcat and Drools allowing customisation to suit company specific needs
- Integrates with client applications, websites or other enterprise applications using remote APIs such as SOAP, Hessian, RMI and others
- Completely scalable; supports lightweight, low transactional models as well as enterprise class billing systems for telecoms and other billing-centric industries
- Full rating engine to tackle very complex pricing
- Secure SSL access and PCI compliant database encryption

System requirements:

- Platform independent java based application can run on Windows or Linux
- Runs on a single server, cluster or virtual server architectures
- Requires Java runtime environment, Tomcat web server and a database solution
- Supports standard databases via JDBC such as: MySQL, Oracle, PostgreSQL

Professional Support & Consulting

Software for a mission critical area of your business needs a solution that is firmly backed by a professional company. Our services include 24x7 support and access to the core developers of jBilling.
